TAUCOIN

Proof of Transaction for on-chain activity

A project overview of TAUCOIN’s stated direction, token facts, and the questions to resolve before investor distribution.

DRAFT • OCTOBER 2026

The idea

A clear starting point for a transaction-centered blockchain project

TAUCOIN references Proof of Transaction (PoT) as a way to think about verifiable blockchain activity and participation.

The exact TAUCOIN PoT rules and implementation need to be confirmed by the project team.

CORE QUESTION

How can transaction activity be measured, verified, and given useful meaning within the TAUCOIN ecosystem?

The problem to define

The pitch should connect a specific user pain to a measurable solution

- What transaction or participation problem does TAUCOIN solve?
- Who experiences that problem: users, developers, businesses, or network participants?
- Why are existing blockchain tools or incentive models insufficient?
- What measurable result would prove TAUCOIN works better?

INVESTOR TEST

Replace broad claims with evidence, user examples, and measurable outcomes.

TAUCOIN’s stated direction

Use PoT as the organizing concept — with the implementation made explicit

01

Observe

Identify the on-chain activity that matters.

02

Verify

Define how activity is checked and what counts.

03

Use

Explain how verified activity affects the product or ecosystem.

This is a conceptual framing, not a claim that these mechanisms are already implemented.

Token snapshot

Known project facts to carry consistently across materials

TOKEN

TAU

STATED SUPPLY

10,000,000 TAU

NETWORK

BNB Chain

GROWTH APPROACH

Community-driven

Token allocation, vesting, utility details, circulating supply, and contract address should be added only after they are verified.

Token utility: define before launch

Avoid vague utility claims — state exactly what TAU enables

The current public information available for this draft does not establish the complete TAU utility model. Confirm each item below before presenting it as live functionality.

- What actions require or use TAU?
- Are any rewards, fees, governance rights, or access features planned or live?
- What prevents spam, wash activity, or low-value transactions from being rewarded?
- Which rules are enforced on-chain, and which are controlled by the project?

Evidence investors will expect

Add real data rather than estimates or unverified claims

PRODUCT

Live demo, architecture, contract addresses

TRACTION

Active users, transactions, retention, growth

SECURITY

Audit status, risks, incident process

ECONOMICS

Allocation, unlocks, liquidity, treasury rules

If data is not available yet, label it as planned or in development.

What to finalize next

A stronger investor deck starts with verified project details

- Confirm the precise definition and technical design of Proof of Transaction.
- Document the product status, use cases, and target users.
- Publish verified tokenomics and the token contract address.
- Add team credentials, roadmap milestones, traction, and security evidence.
- State a clear partnership or fundraising request, if applicable.
